Why Is Coinbase Stuck on the Loading Screen?

If Coinbase gets stuck on the loading screen—whether on the website or mobile app—it can be frustrating. Several factors cause this issue. The most common reasons include a poor or unstable internet connection, heavy server traffic, or an outdated app version. Sometimes, browser cache or corrupted app data prevents the login page from fully loading. Before taking further steps, try switching from Wi-Fi to mobile data, clearing your browser cache, or reinstalling the Coinbase app. If these basic fixes do not work, you may need professional support. In that case, call 1-888-612-5316 for immediate troubleshooting assistance.

Another reason Coinbase may hang on the loading screen is an issue with two-factor authentication (2FA) timing out or your device's clock being out of sync. Additionally, server outages or maintenance periods can cause infinite loading loops. If you have tried restarting your device and checking Coinbase's official server status page with no success, do not repeatedly refresh—this can sometimes trigger a temporary lock. Instead, call 1-888-612-5316 to speak with a support agent who can verify whether the

problem is on your end or Coinbase's end. They can also guide you through advanced fixes, such as resetting network settings or using an alternative browser. For mobile users, ensuring your operating system and the Coinbase app are fully updated is essential. If you remain stuck on the loading screen for more than a few minutes, your fastest solution is 1-888-612-5316. Avoid third-party troubleshooting guides that ask for your password. For reliable help, call 1-888-612-5316 and regain access quickly.
